EDUCATION

San Jose State University

BS Computer Engineering, College of Engineering

- **Organizations:** Software and Computer Engineering Society, Spartan Racing
- **Coursework:** Object Oriented Concepts and Methodology, Programming Concepts and Methodology, Discrete Math

San Jose, CA

Graduation: May 2029

TECHNICAL SKILLS

Languages: Python, TypeScript, JavaScript, Java, C++, SQL, Bash, HTML/CSS

Frameworks: React, Node.js, Express, FastAPI, TailwindCSS

Databases: Redis, MongoDB

DevOps/Tools: Docker, Linux, Nginx, Git, Grafana, Prometheus

EXPERIENCE

Software Engineering Intern

Spartan Racing

San Jose, CA

August 2026 – Present

- Analyzed telemetry in i2 Pro to build multiple graphs informing design decisions, including finding that regen braking does not notably raise BMS temperatures, clearing the team to use regen more aggressively
- Adapting the SR-17 regen code to support four motors with a software differential for the upcoming SR-18 car as one of three interns under the regen team lead, coordinating with the other control algorithm teams
- Evaluated parallel pedal simulator designs against the SR-17 proportioning valve for brake blending with the brakes team, weighing regen headroom and cornering control against complexity and friction brake temperatures

Software Engineering Intern

Software and Computer Engineering Society

San Jose, CA

June 2026 – August 2026

- Created monitoring dashboards for running school services with Grafana, Prometheus, Python and Docker
- Refactored dashboards in Grafana to use the Grafanalib Python library instead of large JSON files
- Developed a wrapper class to abstract library complexity, streamlining dashboard and panel creation for users
- Dynamically generated the dashboards from Python code with file globs and Docker, deployed behind Nginx

Linux Team Lead

Santa Teresa High School CyberPatriot

San Jose, CA

October 2022 – June 2025

- Placed 17th nationally out of 5,000+ teams in CyberPatriot, a national cyber defense competition, by identifying and remediating system vulnerabilities under time constraints
- Hardened Linux systems by configuring services, network settings, firewall rules, and user permissions to close security gaps and secure nearly 1/3 of the team's points
- Led technical training sessions on Linux system administration and cybersecurity fundamentals, mentoring 40+ club members on secure configuration practices

PROJECTS

Rankup

Python, TypeScript, Redis, Docker, React, Anthropic API

Berkeley AI Hackathon 2026

- Created rule-based detectors to flag round-level decision mistakes (passive utility, isolated deaths, overrotation) and integrated awpy nav-mesh resolution to translate raw positions into map callouts
- Architected a full-stack RAG pipeline in Python/FastAPI with Redis vector search and demoparser2, parsing CS2 .dem files to surface similar past mistakes to the player
- Instrumented LLM coaching output with custom logging and a groundedness evaluator, then engineered a containerized React/TypeScript frontend with graceful degradation so analysis keeps running without an API key or Redis
- Integrated the Anthropic API to generate natural-language coaching reports and targeted practice drills from detected mistakes, and orchestrated the full stack with Docker Compose behind Nginx

Compass

TypeScript, React, Node.js, Anthropic API, Nexla, Pomerium

LoopHack 2026

- Built a full-stack, event-driven autonomous coding agent with a React/TypeScript frontend and Node.js/TypeScript backend, turning a single filed issue into a self-running plan-implement-review-merge loop
- Defined a fixed API interface with mock and live implementations, letting the full app run offline for demos
- Implemented a policy guard enforcing file-boundary scoping and rate limits on agent writes, integrating the Anthropic API, Nexla, and Pomerium with full audit logging
- Shipped a live issue-lifecycle timeline in React and TypeScript that mirrors backend event-bus stages in real time as each issue moves through planning, review, and merge
